Process fo MIS AppForge

Here's a practical process flow for the **Internal App Request System** that follows the official Software Development Life Cycle (SDLC) shown in your document. It is designed specifically for employees requesting **new internal applications** or **enhancements/updates** to existing ones.

Overall Process Flow (Aligned with SDLC)

```
None
1. Conception / Ideation
2. Planning
3. Requirements (Functional Specification)
4. Design (Technical Specification)
5. Development
6. Testing
7. Documentation
8. Implementation
9. Training
10. Post-Implementation Evaluation
11. System Maintenance
```

Detailed Process Flow by SDLC Stage

#	SDLC Stage	What Happens in the Request System	Who is Involved	System Features Needed
1	**Conception / Ideation**	Employee identifies a problem or opportunity and submits a request (New App or Enhancement). Basic idea, pain point, and expected benefit are captured.	Requester (Employee)	Request form with type selection (New / Enhancement), problem description, business justification, urgency
2	**Planning**	Manager reviews the request. IT does initial high-level assessment (effort, impact, priority). Decision is made	Manager + IT Lead	Manager approval workflow, initial priority scoring, effort ballpark estimate, reject/defer options

#	SDLC Stage	What Happens in the Request System	Who is Involved	System Features Needed
		whether to proceed, defer, or reject.		
3	**Requirements (Functional Specification)**	Detailed requirements are gathered. Requester and stakeholders clarify what the system should do. Functional specs are documented and signed off.	Requester + Stakeholders + Business Analyst / IT	Requirements gathering form, comment thread, attachment of process docs/screenshots, formal sign-off feature
4	**Design (Technical Specification)**	Technical design is created (architecture, database structure, UI mockups, integrations). Design is reviewed and approved before coding starts.	Developer / System Analyst + IT Lead	Design document upload, mockup attachment, technical review checklist, design approval
5	**Development**	Actual coding/building of the new app or enhancement is done. Progress is updated regularly.	Assigned Developer(s)	Task assignment, progress status updates, developer notes, version tracking
6	**Testing**	Functional, integration, and user acceptance testing (UAT) are performed. Bugs are logged and fixed.	Developer + QA / Requester + End Users	Test case checklist, bug reporting, UAT sign-off form, retest tracking
7	**Documentation**	User manuals, system documentation, and process guides are created or updated.	Developer + Technical Writer / Requester	Document upload section, version control for manuals, link to knowledge base
8	**Implementation**	The system is deployed to the production environment. Go-live checklist is completed.	IT Team + Developer	Deployment checklist, go-live notification, environment status (Staging → Production)
9	**Training**	End users are trained on how to use the new or updated system. Training materials are shared.	Trainer / Developer + Department Users	Training schedule, attendance tracking, training material upload, feedback form

#	SDLC Stage	What Happens in the Request System	Who is Involved	System Features Needed
10	**Post-Implementation Evaluation**	After go-live, the system is evaluated. Feedback is collected on whether it solved the original problem.	Requester + Users + IT	Feedback survey, success metrics, lessons learned form, rating of the delivered solution
11	**System Maintenance**	Ongoing support, bug fixes, minor improvements, and monitoring. Future enhancement requests can be linked back to the original system.	IT Support / Developer	Maintenance ticket linkage, support request form, system health monitoring notes

---

Key Process Rules for Uratex

- **New Applications** → Must go through the full SDLC (Stages 1–11).
- **Enhancements / Updates** → Can use a lighter version (Stages 1–3, 5–6, 8, 10–11). Stages 4, 7, and 9 can be simplified depending on size.
- **Small fixes / quick wins** (very low effort) → Can skip formal Design and full Documentation, but still require Testing and Evaluation.
- Every request must have a unique ID (e.g., `URX-REQ-2026-0087`) and visible status at every stage.

No development work starts until **Requirements** are signed off and **Design** is approved (for medium/large requests).

Visual Status Flow in the System

```
Submitted → Under Manager Review → Planning/Triage → Requirements Gathering
→ Design → Development → Testing → Documentation → Implementation
→ Training → Evaluation → Maintenance / Closed
```
